1. Abstract

For our ICP final project, we created a website called **Cafe de Flore Bakery & Cafe**. The website is designed for a bakery and café where customers can

view menu items, learn about the café, read customer reviews, and place an order through an online form. We used **HTML** to build the structure, **CSS** for styling and layout, and **JavaScript** to make the order form interactive. The website has a simple and attractive design, and the order form shows a confirmation message after submission.

2. Introduction

The main goal of this project was to build a modern café website that is easy to use and visually attractive. Many cafés and restaurants use websites to show their menu and receive customer orders, so we wanted to create a similar website.

Our objectives were:

- To design a complete cafe website.
- To create a clean and responsive layout.
- To add an online order form.
- To use JavaScript for form handling.
- To practice front-end web development skills.

3. Methodology / Implementation

We divided the website into several sections and built each part step by step.

[HTML](#)

We created the basic structure of the website using HTML. The website includes:

- Navigation bar
- Hero section
- Menu highlights
- About section
- Reviews section
- Order form
- Footer

CSS

CSS was used to design websites. We selected soft colors such as cream, brown, and gold to create a warm café theme. We used Flexbox and Grid to arrange different sections properly. Buttons, cards, and text were also styled using CSS.

JavaScript

JavaScript was mainly used for the order form. When the user clicks the Place Order button, the form does not refresh the page. Instead, it shows the message “Order Confirmed!”. The reset button clears the form and hides the confirmation message.

We built the website using HTML, CSS, and JavaScript. HTML was used to create the structure of the website, including the navigation bar, menu section, reviews section, and order form. CSS was used for styling and layout, while JavaScript was used to handle the order form of submission and display the order confirmation message.

4. Results / Output

Our website works successfully and includes all the required sections.

The final website contains:

- A homepage with a café background image.
- A menu section with featured food and drinks.
- A section describing the café.
- A review section showing customer feedback.
- An online order form.
- A confirmation message after submission form.

The order form accepts the customer's name, address, and email/cell number and displays "Order Confirmed!" after submission.

Order Status

Order Confirmed!

5. Challenges and Limitations

While working on this project, we faced a few problems.

One challenge was combining the order form with the existing website design. We also had some issues with spacing, alignment, and connecting the HTML, CSS, and JavaScript files correctly. Another challenge was making the website look neat on different screen sizes.

Some limitations of our website are:

- The order form does not save customer information.
- There is no database connection.
- Online payment is not available.
- The gallery page is not implemented.

6. Conclusion and Discussion

This project helped us understand how HTML, CSS, and JavaScript work together to create a complete website. We learned how to design different webpage sections, create responsive layouts, and add interactive features using JavaScript.

The website looks organized and provides basic information about the café. The order form also works properly by showing a confirmation message. Overall, we were able to complete our project successfully and improve our web development skills.

7. Future Work

In the future, we would like to improve the website by adding:

- A shopping cart
- Online payment
- Table reservation
- A complete gallery page
- User accounts
- A database to store orders
- A mobile-friendly navigation menu

These features would make the website more useful for a real café business.

9. Individual Contributions

Zarin Abeda Moumita

Worked on the HTML structure of the website. Designed the navigation bar, homepage, menu section, about section, reviews section, order form, and footer, and organized the overall layout of the website.

Wahiba Wadud Safa

Worked on the JavaScript part of the website. Implemented the order form functionality, order confirmation message, reset button, and tested the website to make sure everything worked properly.

Tasnima Nahar

Worked on the CSS styling of the website. Designed the colors, fonts, spacing, buttons, and layout, and made the website responsive and visually organized.

-All three members worked together on planning the website, testing the final version, and making necessary improvements before submission.
